Evolutionary Theory

Roman History

Context

Theoretical Side

Empirical Side

Find the good “rules” and “something unexpected” will happen.

Why sometime, Computer and Living 'stuff' show similar properties?

Simple rules, simple modifications, complex mechanism

FIGURE 11.14 Effects of outcrossing and inbreeding on stature in corn. The two plants at the left are both inbred, homozygous strains. The third plant from the left is the F_1 offspring of those two strains, which displays heterosis ("hybrid vigor"). Successive self-fertilized generations from the F_1 are shown to the right. They display inbreeding depression in their stature, as well as in fitness components such as seed production. (From Jones 1953.)

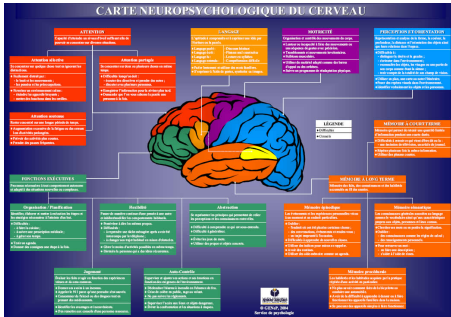

A remaining frustration...

Feeling like :

Computers, Evolution and Roman Economy

Biology and Informatics

Evolutionary Theory

Context

Empirical Side

FIGURE 1. Rice plants showing the growth habit of the *Salween* rice variety. The plants are tall and slender, with long, thin leaves and a central stalk. The plants are growing in rows, and the background is a light, possibly overexposed area, suggesting a field setting.

► The Theory of Evolution?

Study of speciation & specialisation by
artificially evolve swarm of robots.

...

Philosophy of Biology

What am I *really* learning with that? Who will I convince?

- ▶ What is the Evolutionary Theory?
- ▶ How can I study it?
- ▶ What are the tools I used and how/why they can help me?

How to use artificial model to study Evolutionary Biology

What is a model? What is a theory? an explanation ? What is the Theory of Evolution? Lamarck? Darwin? Spencer? The Biometricians? Mendelism? The Modern Synthesis? Dawkin? Gould? ...

Figure: From Godfrey-Smith 2009

And with all that?

Data

About 47000 amphora from CEIPAC database and other data in other databases (places in Pleiade, Greek names in Oxford...)

What was the nature of the Roman Economy?

The primitivism/modern debate

"The Roman Economy was already a free-market similar as today"

VS

"All price were fixed by the state, no free market, use of slave."

How to do this?

EPNET: A transdisciplinary project to shed new lights and bring quantitative arguments to the historians' debate :

- ▶ Historical and Archaeological investigation
- ▶ Sparql Ontologie
- ▶ Network analysis
- ▶ Simulation

ECONOMIC & POLITICAL
NETWORK

Starting Point: A Simple Model

An Agent Based Model mixing two main aspects (WSC – 2015):

1. a simple bartering mechanism,
2. and (cultural) evolutionary dynamics.

Goal

Implement a “simple” theoretical abstract model where economy is seen as a particular cultural attribute co-evolving with other cultural traits:

- ▶ theoretical study interaction of those mechanism (evolution-culture-economics) and the dynamics of such interactions.
- ▶ test historical hypothesis

More details about the model :

1. Barter Mechanism

- ▶ Agent $\begin{cases} \text{Goods} \\ \text{Value attributed to each goods} \end{cases}$
- ▶ Each Agent *produces* one good and *exchange* it with the other goods given their respecting value.
- ▶ After the exchange, the agents *consume* the goods and are *ranked* given a shared utility function.

More details about the model :

2. Evolutionary Dynamics

After 10 steps of exchange :

- ▶ The less successful (in term of utility) agents copy the set of value of the most successful agent (Biased-Copy/selection).
- ▶ Given a probability μ the value attributed to some goods are modified (Innovation/Mutation)

Dynamic of the Model

Result for 3 goods and 500 agents

Without surprise, the system evolves toward an equilibrium where all agents adopt optimal prices (clearing-market prices).

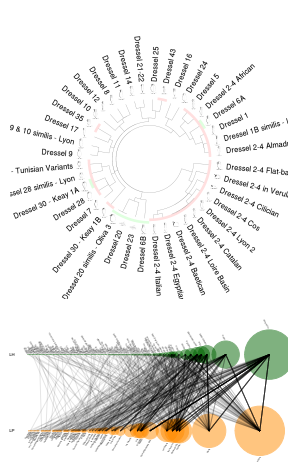

Further Development

- ▶ Network topologies (ongoing)
- ▶ Multilevel dynamics (Province vs Economical Agents...)
- ▶ Evolution of specialisation
- ▶ Economy as a Complex Adaptive System...

A model itself doesn't have any Historical meaning, it needs to always interact with the data:

- ▶ Phylogenetics analyse (using archeometry, amphora typology...),
- ▶ Network Analysis (using stamps and tituli pictii...),
- ▶ Hypothese generation,
- ▶ Model testing...

Some problems that slow us:

- ▶ Archaeological & Historical Data
- ▶ Transdisciplinarity between Humanities and Sciences.

Questions that will remain in the background all that time :

- ▶ Is it possible to study History with quantitatives methods?
- ▶ What is the link between cultural and Biological Evolution?
- ▶ Evolution, an “Historical Science”? or History a branch o Evolutionary Studies?
- ▶ How computer model and simulation can bring knowledge and why?
- ▶ ...

Thank for you attention!
